## **6-Substituted Pyrido-Pyrimidines**

### **CROSS REFERENCE TO RELATED APPLICATIONS**

This application claims benefit under Title 35 U.S.C. §119 (e), of U.S. Provisional Patent  
5 Applications Serial No. 60/268,375, filed February 12, 2001, and Serial No. 60/334,654, filed  
November 30, 2001, the disclosures of which are herein incorporated by reference.

### **FIELD OF THE INVENTION**

The present invention relates to pyridopyrimidines and derivatives thereof. In  
10 particular, the present invention provides 2,6-disubstituted 7-oxo-pyrido[2,3-d]pyrimidines, a process for their manufacture, pharmaceutical preparations comprising the same, and methods for using the same.

### **BACKGROUND OF THE INVENTION**

15 Mitogen-activated protein kinases (MAP) is a family of proline-directed serine/threonine kinases that activate their substrates by dual phosphorylation. The kinases are activated by a variety of signals including nutritional and osmotic stress, UV light, growth factors, endotoxin and inflammatory cytokines. One group of MAP kinases is the p38 kinase group that includes various isoforms (*e.g.*, p38 $\alpha$ , p38 $\beta$ , p38 $\gamma$  and p38 $\delta$ ). The p38 kinases are responsible for  
20 phosphorylating and activating transcription factors as well as other kinases, and are activated by physical and chemical stress, pro-inflammatory cytokines and bacterial lipopolysaccharide.

More importantly, the products of the p38 phosphorylation have been shown to mediate the production of inflammatory cytokines, including TNF and IL-1, and cyclooxygenase-2. Each of these cytokines has been implicated in numerous disease states and conditions. For example,  
25 TNF- $\alpha$  is a cytokine produced primarily by activated monocytes and macrophages. Its excessive or unregulated production has been implicated as playing a causative role in the pathogenesis of rheumatoid arthritis. More recently, inhibition of TNF production has been shown to have broad application in the treatment of inflammation, inflammatory bowel disease, multiple sclerosis and asthma.

30 TNF has also been implicated in viral infections, such as HIV, influenza virus, and herpes virus including herpes simplex virus type-1 (HSV-1), herpes simplex virus type-2 (HSV-2),

cytomegalovirus (CMV), varicella-zoster virus (VZV), Epstein-Barr virus, human herpes virus-6 (HHV-6), human herpesvirus-7 (HHV-7), human herpesvirus-8 (HHV-8), pseudorabies and rhinotracheitis, among others.

Similarly, IL-1 is produced by activated monocytes and macrophages, and plays a role in many pathophysiological responses including rheumatoid arthritis, fever and reduction of bone resorption.

Additionally, the involvement of p38 has been implicated in stroke, Alzheimer's disease, osteoarthritis, lung injury, septic shock, angiogenesis, dermatitis, psoriasis and atopic dermatitis. *J. Exp. Opin. Ther. Patents*, (2000) 10(1).

10 The inhibition of these cytokines by inhibition of the p38 kinase is of benefit in controlling, reducing and alleviating many of these disease states.

Certain 6-aryl-pyrido[2,3-d]pyrimidin-7-ones, -7-imines and -7-thiones are disclosed as inhibitors of protein tyrosine kinase mediated cellular proliferation in WO 96/34867, published November 7, 1996 (Warner Lambert). Other 6-aryl-pyrido[2,3-d]pyrimidines and

15 naphthyridines are also disclosed as inhibitors of tyrosine kinase in WO 96/15128, published May 23, 1996 (Warner Lambert). 6-alkyl-pyrido[2,3-d]pyrimidin-7-ones are disclosed as inhibitors of cyclin-dependent kinases in WO 98/33798, published August 6, 1998 (Warner Lambert). Certain 4-amino-pyridopyrimidines are disclosed as inhibitors of dihydrofolate reductase in EP 0 278 686A1, published August 8, 1988 (Wellcome Foundation).

10 "Protecting group" refers to a grouping of atoms that when attached to a reactive group in a molecule masks, reduces or prevents that reactivity. Examples of protecting groups can be found in T.W. Green and P.G. Futs, Protective Groups in Organic Chemistry, (Wiley, 2<sup>nd</sup> ed. 1991) and Harrison and Harrison et al., Compendium of Synthetic Organic Methods, Vols. 1-8 (John Wiley and Sons, 1971-1996). Representative amino protecting groups include, formyl, 15 acetyl, trifluoroacetyl, benzyl, benzyloxycarbonyl (CBZ), *tert*-butoxycarbonyl (Boc), trimethylsilyl (TMS), 2-trimethylsilyl-ethanesulfonyl (SES), trityl and substituted trityl groups, allyloxycarbonyl, 9-fluorenylmethyloxycarbonyl (FMOC), nitro-veratryloxycarbonyl (NVOC), and the like. Representative hydroxy protecting groups include those where the hydroxy group is either acylated or alkylated such as benzyl, and trityl ethers as well as alkyl ethers, 20 tetrahydropyranyl ethers, trialkylsilyl ethers and allyl ethers.

25 "Treating" or "treatment" of a disease includes: (1) preventing the disease, i.e., causing the clinical symptoms of the disease not to develop in a mammal that may be exposed to or predisposed to the disease but does not yet experience or display symptoms of the disease; (2) inhibiting the disease, i.e., arresting or reducing the development of the disease or its clinical symptoms; or (3) relieving the disease, i.e., causing regression of the disease or its clinical symptoms.

30 "A therapeutically effective amount" means the amount of a compound that, when administered to a mammal for treating a disease, is sufficient to effect such treatment for the disease. The "therapeutically effective amount" will vary depending on the compound, the disease and its severity and the age, weight, etc., of the mammal to be treated.

15 The compounds of the present invention can exist in unsolvated forms as well as solvated  
forms, including hydrated forms. In general, the solvated forms, including hydrated forms, are  
equivalent to unsolvated forms and are intended to be encompassed within the scope of the  
present invention. In addition to the compounds described above, the compounds of the present  
invention include all tautomeric forms. Furthermore, the present invention also includes all  
20 pharmaceutically acceptable salts of those compounds along with prodrug forms of the  
compounds and all stereoisomers whether in a pure chiral form or a racemic mixture or other  
form of mixture.

25 The compounds of Formula I and II are capable of further forming  
pharmaceutically acceptable acid addition salts. All of these forms are within the scope of the  
present invention.

Pharmaceutically acceptable acid addition salts of the compounds of Formula I  
and II include salts derived from inorganic acids such as hydrochloric, nitric, phosphoric,  
sulfuric, hydrobromic, hydriodic, phosphorous, and the like, as well as the salts derived from

etc. Such salts thus include sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, nitrate, phosphate,

monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, caprylate, isobutyrate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, mandelate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, phthalate, benzenesulfonate, toluenesulfonate, phenylacetate, citrate, lactate, 5 maleate, tartrate, methanesulfonate, and the like. The free base form can be regenerated by contacting the salt form with a base and isolating the free base in the conventional manner. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free base for purposes of the present invention.

30 While the forms of the invention herein constitute presently preferred embodiments, many others are possible. It is not intended herein to mention all of the possible

equivalent forms or ramifications of the invention. It is understood that the terms used herein are merely descriptive rather than limiting, and that various changes can be made without departing from the spirit or scope of the invention.

## 5 Processes for Preparing the Compounds

The compounds of the present invention can be prepared by a variety of methods. In one aspect of the present invention, a method for preparing compounds of Formula I where Z is N is shown in Scheme 1 below. It should be appreciated that although the scheme often indicates exact structures, methods of the present invention apply widely to analogous 10 compounds of Formula I or II, given appropriate consideration to protection and deprotection of reactive functional groups by methods standard to the art of organic chemistry. For example, hydroxy groups, in order to prevent unwanted side reactions, sometimes need to be converted to ethers or esters during chemical reactions at other sites in the molecule. The hydroxy protecting group is then removed to provide the free hydroxy group. Similarly, amino groups and 15 carboxylic acid groups can be derivatized to protect them against unwanted side reactions. Typical protecting groups, and methods for attaching and cleaving them, are described fully in the above incorporated references by T.W. Greene and P.G.M. Wuts, *Protective Groups in Organic Synthesis*, 3<sup>rd</sup> edition, John Wiley & Sons, New York, 1999, and Harrison and Harrison et al., *Compendium of Synthetic Organic Methods*, Vols. 1-8 (John Wiley and Sons, 1971-1996).

Scheme 1

Treatment of a compound of Formula **Ia** with a primary amine ( $R^3\text{-NH}_2$ ) provides a compound of Formula **Ib**. This reaction is conveniently carried out in a solvent which is inert under the reaction conditions, preferably a halogenated aliphatic hydrocarbon, especially dichloromethane, an optionally halogenated aromatic hydrocarbon, or an open-chain or cyclic ether such as tetrahydrofuran, a formamide or a lower alkanol. Suitably, the reaction is carried out at about -20 °C to about 120 °C.

Reduction of a compound of Formula **Ib** provides an alcohol of Formula **Ic**. This reduction is typically carried out using lithium aluminum hydride in a manner well known to those of skill in the art (e.g., in a solvent which is inert under the conditions of the reduction, preferably an open-chain or cyclic ether, especially tetrahydrofuran, at about -20 °C to about 70 °C, preferably at about 0 °C to about room temperature).

Oxidation of an alcohol of Formula **Ic** provides a carboxaldehyde of Formula **Id**. The oxidation is typically carried out with manganese dioxide, although numerous other methods can also be employed (see, for example, ADVANCED ORGANIC CHEMISTRY, 4<sup>TH</sup> ED., March, John Wiley & Sons, New York (1992)). Depending on the oxidizing agent employed, the reaction is carried out conveniently in a solvent which is inert under the specific oxidation conditions, preferably a halogenated aliphatic hydrocarbon, especially dichloromethane, or an optionally

halogenated aromatic hydrocarbon. Suitably, the oxidation is carried out at about 0 °C to about 60 °C.

Reaction of a carboxaldehyde of Formula **Id** with an ester,  $\text{Ar}^1-\text{X}^1\text{CH}_2-\text{CO}_2\text{R}'$  (where  $\text{R}'$  is an alkyl group, and  $\text{Ar}^1$  and  $\text{X}^1$  are those defined above) in the presence of a base 5 provides a compound of Formula **Ie**. Any relatively non-nucleophilic base can be used including carbonates, such as potassium carbonate, lithium carbonate, and sodium carbonate; bicarbonates, such as potassium bicarbonate, lithium bicarbonate, and sodium bicarbonate; amines, such as secondary and tertiary amines; and resin bound amines such as 1,3,4,6,7,8-hexahydro-2H pyrimido[1,2-a]pyrimidine. Conveniently, the reaction is carried out in a solvent which is 10 relatively polar but inert under the reaction conditions, preferably an amide such as dimethyl formamide, N-substituted pyrrolidinone, especially 1-methyl-2-pyrrolidinone, and at a temperature of about 25 °C to about 150 °C.

Oxidation of **Ie** with an oxidizing agent, e.g. a peracid such as 3-chloroperbenzoic acid (i.e., MCPBA) or Oxone®, provides a sulfone (**If**) which can be converted to a variety of 15 target compounds. Typically the oxidation of **Ie** is carried out in a solvent which is inert under the conditions of the oxidation. For example, when MCPBA is used as the oxidizing agent, the solvent is preferably a halogenated aliphatic hydrocarbon, especially chloroform. When Oxone® is used as the oxidizing agent, the solvent is preferably methanol, aqueous ethanol or aqueous tetrahydrofuran. The reaction temperature depends on the solvent used. For an organic solvent, 20 the reaction temperature is generally at about -20 °C to about 50 °C, preferably about 0 °C to about room temperature. When water is used as the solvent, the reaction temperature is generally from about 0 °C to about 50 °C, preferably about 0 °C to about room temperature. Alternatively, the oxidation may be carried under catalytic conditions with rhenium/peroxide 25 based reagents, see (“Oxidation of Sulfoxides by Hydrogen Peroxide, Catalyzed by Methyltrioxorhenium(VII)”, Lahti, David W.; Espenson, James H, *Inorg. Chem.* (2000) 39(10) pp.2164-2167; “Rhenium oxo complexes in catalytic oxidations, *Catal. Today* (2000) 55(4), pp317-363 and “A Simple and Efficient Method for the Preparation of Pyridine N-Oxides”, Coperet, Christophe; Adolfsson, Hans; Khuong, Tinh-Alfredo V.; Yudin, Andrei K.; Sharpless, K. Barry, *J. Org. Chem.* (1998) 63(5), pp1740-1741).

30 Reacting the compound **If** with an amine ( $\text{R}'^1-\text{NH}_2$ ) provides the compounds of Formula **I'** (i.e., compounds **I**, wherein W is NH). Further alkylation of **I'** then provides

compounds of Formula I, where W is NR<sup>2</sup>, where R<sup>2</sup> is alkyl. The reaction can be carried out in the presence or absence of solvent. Conveniently, the reaction is carried out at temperatures of from about 0 °C to about 200 °C, more preferably about room temperature to about 150 °C.

Alternatively, in some cases rather than using the sulfone If, the sulfide Ie or the corresponding sulfoxide can be reacted directly with an amine (R<sup>1</sup>-NH<sub>2</sub>) to provide the compounds of Formula I'.  
5

Accordingly, the present invention provides a method of preparing compounds of Formula I, by treating a compound of general Formula Ie, If or the corresponding sulfoxide with an amine (R<sup>1</sup>-NH<sub>2</sub>) and optionally reacting the resulting product with R<sup>2</sup>-L, where R<sup>2</sup> is alkyl  
10 and L is a leaving group.

Compounds of Formula I where R<sup>3</sup> is amino, monoalkylamino, dialkylamino or NR<sup>32</sup>-Y<sup>3</sup>-R<sup>33</sup> may be prepared as shown in Scheme 2 from the corresponding 2-alkylthio-8-amino-[2,3-d]pyridopyrimidin-7(8H)-one (IV, Z=N) or 7-alkylthio-1-amino-1,6-naphthyridin-2-one (IV, Z=CH) shown in Scheme 2 by amination with O-diphenylphosphinylhydroxylamine.

a. The aminating reagent (O-diphenylphosphinylhydroxylamine) was prepared according to literature procedure (Colvin, E.W.; Kirby, G.W.; Wilson, A.C. *Tetrahedron Lett.* 1982, 23, 3835. For its use see:  
 Klotz, W.; Stadlwieser, J.; Raneburger, J. *Org. Synth.* 1986, 64, 96-103.

Scheme 2

Displacement of the sulfide (or the corresponding sulfoxide or sulfone with an amine  $R^1NH_2$  as previously described for compound **Ie** in Scheme 1 provides compounds of Formula **I** (compounds of Formula I where Z is CH and  $R^2$  is H). Reacting the resulting product 5 with  $R^2-L$ , where  $R^2$  is alkyl and L is a leaving group gives compounds of Formula I where  $R^2$  is alkyl.

Compounds of Formula I where Z is CH may be prepared as shown in Scheme 3.

Scheme 3

4-amino-3,6-dibromo-pyridine (Den Hertog et. al., *Rec. Trav. Chim. Pays-Bas*, **64** 85-100 (1945) is treated with sodium methyl thiolate to give 4-amino-3-bromo-6-methylthiopyridine (Step a, see Windscheif, P; Voegtle, F.; *Synthesis*, 87092 (1994). The 5 methylthiopyridine is coupled in a Heck reaction under palladium catalysis (e.g. palladium acetate) in the presence of base (e.g. potassium acetate or tributylamine) with the vinyl ester **2a** to give a compound of Formula **2b** (see Dong, Y.; Busacca, C.A. *J. Org. Chem.*, **62**, 6464-65 (1997). Ring closure under basic conditions gives a 1,6-naphthyridone of Formula **2c**. Alkylation of **2c** with an alkyl halide (or any other alkylating agent  $R^3\text{-}X$  where X is a leaving 10 group) gives a 1-alkylated naphthyridone of Formula **2d**. Oxidation of **2d** and displacement of the sulfone with an amine  $R^1\text{NH}_2$  as previously described for compound **Ie** in Scheme 1 provides compounds of Formula **I''** (compounds of Formula I where Z is CH and  $R^2$  is H). Reacting the resulting product with  $R^2\text{-L}$ , where  $R^2$  is alkyl and L is a leaving group gives compounds of Formula I where  $R^2$  is alkyl. An alternative route is shown in Scheme 3A.

15

An example of this route is shown in Example 88.

Compounds of Formula II may be prepared as shown in Scheme 4.

Scheme 4

5

Reaction of a carboxaldehyde of Formula **Id** ( $R^3$  is H) with a nitrile,  $\text{Ar}^1\text{X}^1\text{CH}_2\text{CN}$  (where  $\text{Ar}^1$  and  $\text{X}^1$  are those defined above) in the presence of a base under conditions similar to those described for conversion of **Id** to **Ie** in Scheme 1 provides a compound of Formula **IIIe**.

Compounds of Formula **IIIe** may be sequentially alkylated, acylated or sulfonated with

10 alkylating agents, acyl halides, isocyanates, anhydrides and sulfonyl halides to provide compounds of Formula **IIIf** where  $R^8$  and  $R^9$  are as described in the Summary of the Invention.

Subsequent oxidation of **IIIf** and displacement of the sulfone with an amine  $\text{R}^1\text{NH}_2$  as previously described for compound **Ie** in Scheme 1 provides compounds of Formula **III'**. Further reacting

the resulting product with  $R^2$ -L, where  $R^2$  is alkyl and L is a leaving group gives compounds of Formula **II** where  $R^2$  is alkyl.

One of skill in the art will understand that certain modifications to the above schemes are contemplated and within the scope of the present invention. For example, certain 5 steps will involve the use of protecting groups for functional groups that are not compatible with particular reaction conditions.

#### Pharmaceutical Compositions Containing the Compounds

The compounds of Formula **I** and **II** and the pharmaceutically acceptable salts of 10 basic compounds of Formula **I** and **II** with acids can be used as medicaments, *e.g.*, in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered enterally, *e.g.*, orally in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, nasally, *e.g.*, in the form of nasal sprays, or rectally, *e.g.*, in the 15 form of suppositories. However, they may also be administered parenterally, *e.g.*, in the form of injection solutions.

The compounds of Formula **I** and **II** and their aforementioned pharmaceutically acceptable salts can be processed with pharmaceutically inert, organic or inorganic carriers for 20 the production of pharmaceutical preparations. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts and the like can be used, for example, as such carriers for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carriers for soft gelatine capsules are, for example, vegetable oils, waxes, fats, semi-solid and liquid polyols and the like; depending on the nature of the active ingredient no carriers are, however, usually required in the case of soft 25 gelatine capsules. Suitable carriers for the production of solutions and syrups are, for example, water, polyols, sucrose, invert sugar, glucose and the like. Suitable carriers for suppositories are, for example, natural or hardened oils, waxes, fats, semi-liquid or liquid polyols and the like.

As used herein, the term “TNF mediated disorder” refers to any and all disorders and disease states in which TNF plays a role, either by control of TNF itself, or by TNF causing 10 another monokine to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to TNF, would therefore be considered a disorder mediated by TNF.

As used herein, the term “p38 mediated disorder” refers to any and all disorders and disease states in which p38 plays a role, either by control of p38 itself, or by p38 causing 15 another factor to be released, such as but not limited to IL-1, IL-6 or IL-8. A disease state in which, for instance, IL-1 is a major component, and whose production or action, is exacerbated or secreted in response to p38, would therefore be considered a disorder mediated by p38.

As TNF- $\beta$  has close structural homology with TNF- $\alpha$  (also known as cachectin), and since each induces similar biologic responses and binds to the same cellular receptor, the 20 synthesis of both TNF- $\alpha$  and TNF- $\beta$  are inhibited by the compounds of the present invention and thus are herein referred to collectively as “TNF” unless specifically delineated otherwise.

The volatiles were evaporated at 60 ° C to provide a thick residue which was dissolved in 4 mL of acetone at 67-70 ° C. To the resulting solution was added 5 mL of hexane maintaining a temperature of 53-55 ° C. This mixture was allowed to cool to ambient

Example 113 : Preparation of 4-Amino-2-methylthiopyrimidine-5-carbaldehyde

*Preparation of 3,3-Diethoxy-2-formylpropionitrile Potassium Salt (II)*

5 To a stirred solution of 3,3-diethoxypropane-nitrile (I, 283.80 g, 1.98 moles) and methyl formate (148.80 g, 2.48 moles) in anhydrous THF (1.1 L) at 10°C was added 1.0 M potassium *tert*-butoxide in THF (2.2 L, 2.2 moles). Temperature was maintained in the range of 10 °C to 15 °C throughout the 45 minute addition. Following the addition, the resulting slurry was stirred 2 hours at ambient room temperature. Hexane (400 mL) was then added and stirring was

10 continued for another 20 min. The slurry was filtered and the cake washed with 1/1 hexanes/THF and dried overnight at 60 °C in a vacuum oven. The yield of pale tan powder was 302.5 grams (73.0%).  $^1\text{H-NMR}$  ( $\text{CD}_3\text{OD}$ ) was consistent with the desired structure II.

*Preparation of 4-Amino-2-sulfanylpyrimidine-5-carbaldehyde (III)*

A slurry of thiourea (92.8 g, 1.22 moles) in ethanol (90 mL) was heated under reflux and

15 vigorously stirred. To this slurry was added a suspension of 3,3-diethoxy-2-formylpropionitrile potassium salt II (222.20 g, 1.06 moles) in 25% sodium methoxide/methanol (85.5 mL, 0.37 mole) and ethanol (285 mL) in five aliquots over a 10 minute period while maintaining reflux conditions (alternatively, the latter slurry may be heated to 50°C to give a homogenous solution for the addition). An additional portion of ethanol (150 mL) was added to facilitate stirring. The

20 thick slurry became a bright yellow color following the addition and was held under reflux for an additional 1 hour. The mixture was then cooled and evaporated to near dryness on a rotovap. The residue was dissolved in water (940 mL). Crude product was precipitated from solution by the addition of 30% acetic acid (280 mL) and isolated via filtration using a medium frit sintered glass filtration funnel. The cake was washed with water (800 mL).

25 Purification via trituration in hot water (1 L) for 30 minutes, followed by cooling and filtration gave 118.9 grams (72.3%) of product as a bright yellow solid after drying overnight at 60 °C in a vacuum oven (subsequent preparations have demonstrated that this trituration is unnecessary). An HPLC gave purity as 98.67%.  $^1\text{H-NMR}$  ( $\text{DMSO-d}_6$ ) was consistent with desired structure III.

*Preparation of 4-Amino-2-methylthiopyrimidine-5-carbaldehyde (IV)*

To a solution of 4-amino-2-sulfanyl-pyrimidine-5-carbaldehyde **III** (100.00 g, 644.4 mmoles)

and 325 mesh potassium carbonate (178.10 g, 1.29 moles) in acetone (1.5 L) was added

iodomethane (128.10 g, 902.2 mmoles) dropwise over 20 minutes with mild cooling. The

5 mixture was stirred at ambient room temperature over the weekend. TLC showed remaining **III** and an additional aliquot of iodomethane was added (8 mL) and stirring was continued

overnight. TLC again showed some **III** remaining and an addition portion of iodomethane was

added (8 mL) and stirring was continued another 24 hour period. An HPLC showed 95.9% S-

alkylated product and 3.7% of compound **III**. The reaction mixture was stripped to near dryness

10 on a rotoevaporator. Water (1 L) was added to the residue and the product was collected via

filtration and washed with water (200 mL). The product was dried overnight in a vacuum oven

at 60 °C. Yield was 103.37 grams (94.8%). An HPLC showed 95.8% **IV** and 4.2% **III**.

**Example 114**

15 This example illustrates a p38 (MAP) kinase *in vitro* assay useful for evaluating the compounds of the present invention.

The p-38 MAP kinase inhibitory activity of compounds of this invention *in vitro* was determined by measuring the transfer of the  $\gamma$ -phosphate from  $\gamma$ -<sup>33</sup>P-ATP by p-38 kinase to Myelin Basic Protein (MBP), using a minor modification of the method described in Ahn, *et al.*, 20 *J. Biol. Chem.* **266**:4220-4227 (1991).

The phosphorylated form of the recombinant p38 MAP kinase was co-expressed with SEK-1 and MEKK in E. Coli (see, Khokhlatchev, *et al.*, *J. Biol. Chem.* **272**:11057-11062 (1997)) and then purified by affinity chromatography using a Nickel column.

The phosphorylated p38 MAP kinase was diluted in kinase buffer (20 mM 3-(N-morpholino)propanesulfonic acid, pH 7.2, 25 mM  $\beta$ -glycerol phosphate, 5 mM ethylene glycol-bis(beta-aminoethyl ether)-N,N,N',N'-tetraacetic acid, 1 mM sodium ortho-vanadate, 1 mM dithiothreitol, 40 mM magnesium chloride). Test compound dissolved in DMSO or only DMSO (control) was added and the samples were incubated for 10 min at 30°C. The kinase reaction was initiated by the addition of a substrate cocktail containing MBP and  $\gamma$ -<sup>33</sup>P-ATP. After 30 incubating for an additional 20 min at 30°C, the reaction was terminated by adding 0.75%

phosphoric acid. The phosphorylated MBP was then separated from the residual  $\gamma$ - $^{33}$ P-ATP using a phosphocellulose membrane (Millipore, Bedford, MA) and quantitated using a scintillation counter (Packard, Meriden, CT).

5    **Example 115**

This example illustrates an *in vitro* assay to evaluate the inhibition of LPS-induced TNF- $\alpha$  production in THP1 cells.

The ability of the compounds of this invention to inhibit the TNF- $\alpha$  release was determined using a minor modification of the methods described in Blifeld, *et al.*

10    *Transplantation*, 51:498-503 (1991).

(a)    **Induction of TNF biosynthesis:**

THP-1 cells were suspended in culture medium [RPMI (Gibco-BRL, Gailthersburg, MD) containing 15% fetal bovine serum, 0.02 mM 2-mercaptoethanol], at a concentration of  $2.5 \times 10^6$  cells/mL and then plated in 96 well plate (0.2 mL aliquots in each well). Test compounds were dissolved in DMSO and then diluted with the culture medium such that the final DMSO concentration was 5%. Twenty five  $\mu$ L aliquots of test solution or only medium with DMSO (control) were added to each well. The cells were incubated for 30 min., at 37 °C. LPS (Sigma, St. Louis, MO) was added to the wells at a final concentration of 0.5  $\mu$ g/ml, and cells were incubated for an additional 2 h. At the end of the incubation period, culture supernatants were collected and the amount of TNF- $\alpha$  present was determined using an ELISA assay as described below.

(b)    **ELISA Assay:**

The amount of human TNF- $\alpha$  present was determined by a specific trapping ELISA assay using two anti-TNF- $\alpha$  antibodies (2TNF-H12 and 2TNF-H34) described in Reimund, J. M., et al. *GUT*. Vol. 39(5), 684-689 (1996).

Polystyrene 96-well plates were coated with 50  $\mu$ l per well of antibody 2TNF-H12 in PBS (10  $\mu$ g/mL) and incubated in a humidified chamber at 4 °C overnight. The plates were washed with PBS and then blocked with 5% nonfat-dry milk in PBS for 1 hour at room temperature and washed with 0.1% BSA (bovine serum albumin) in PBS.

TNF standards were prepared from a stock solution of human recombinant TNF- $\alpha$  (R&D Systems, Minneapolis, MN). The concentration of the standards in the assay began at 10 ng/mL followed by 6 half log serial dilutions.

Twenty five  $\mu$ L aliquots of the above culture supernatants or TNF standards or 5 only medium (control) were mixed with 25  $\mu$ L aliquots of biotinylated monoclonal antibody 2TNF-H34 (2  $\mu$ g/mL in PBS containing 0.1% BSA) and then added to each well. The samples were incubated for 2 hr at room temperature with gentle shaking and then washed 3 times with 10 0.1% BSA in PBS. 50  $\mu$ L of peroxidase-streptavidin (Zymed, S. San Francisco, CA) solution containing 0.416  $\mu$ g/mL of peroxidase-streptavidin and 0.1% BSA in PBS was added to each well. The samples were incubated for an additional 1 hr at room temperature and then washed 4 times with 0.1% BSA in PBS. Fifty  $\mu$ L of O-phenylenediamine solution (1  $\mu$ g/mL O-phenylenediamine and 0.03 % hydrogen peroxide in 0.2M citrate buffer pH 4.5) was added to each well and the samples were incubated in the dark for 30 min., at room temperature. Optical density of 15 the sample and the reference were read at 450 nm and 650 nm, respectively. TNF- $\alpha$  levels were determined from a graph relating the optical density at 450 nm to the concentration used.

The IC<sub>50</sub> value was defined as the concentration of the test compound corresponding to half-maximal reduction in 450 nm absorbance.

#### Example 116

20 This example illustrates an *in vivo* assay to evaluate the inhibition of LPS-induced TNF- $\alpha$  production in mice (or rats).

The ability of the compounds of this invention to inhibit the TNF- $\alpha$  release, *in vivo*, was determined using a minor modification of the methods described in described in 25 Zanetti, *et. al.*, *J. Immunol.*, **148**:1890 (1992) and Sekut, *et. al.*, *J. Lab. Clin. Med.*, **124**:813 (1994).

Female BALB/c mice weighing 18-21 grams (Charles River, Hollister, CA) were acclimated for one week. Groups containing 8 mice each were dosed orally either with the test compounds suspended or dissolved in an aqueous vehicle containing 0.9% sodium chloride, 0.5% sodium carboxymethyl-cellulose, 0.4% polysorbate 80, 0.9% benzyl alcohol (CMC 30 vehicle) or only vehicle (control group). After 30 min., the mice were injected intraperitoneally

with 20 µg of LPS (Sigma, St. Louis, MO). After 1.5 h, the mice were sacrificed by CO<sub>2</sub> inhalation and blood was harvested by cardiocentesis. Blood was clarified by centrifugation at 15,600 X g for 5 min., and sera were transferred to clean tubes and frozen at -20°C until analyzed for TNF-α by ELISA assay (Biosource International, Camarillo, CA) following the manufacturer's protocol.

Representative compounds of the present invention are shown in Table 1 below. Compounds of Table 1 have  $IC_{50}$  activity against p38 kinase in the range of from about 0.1 to 5000 nM, with the majority being between 1 to 1000 nM and are surprisingly selective for p38 kinase relative to cyclin-dependent kinases and tyrosine kinase.
